

Bounty funding should be verifiable before work begins.

A sponsor locks the promised test-token reward before work. A maintainer releases it when work is accepted—or the sponsor recovers it after expiry.

Why Solana

Publicly verifiable program state · fast settlement · explicit token-vault authority

Human approval stays human.

Escrow proves funding and settlement rules; it does not judge work quality or guarantee acceptance.

The devnet MVP proves settlement, recovery and failure boundaries.

ONE CANONICAL RUN · 16 TERMINAL EVENTS

12

finalized SEND

3

read-only SIMULATE

1

bounded WAIT

Final accounting reconciles

3,000,000 minted = 1,000,000 contributor + 2,000,000 sponsor

Recorded vault principal reaches zero.

Turn the primitive into a workflow.

Connect escrow identity and status to repository, issue and pull-request workflows—while retaining explicit maintainer-authorized release.

Honest limits

Unaudited · devnet/test tokens only · no dispute resolution · no persistence/recovery · no production operations
